

# European students planning to practice internal medicine are more likely to have condition-focused, than behaviour-focused approach to HIV testing

Justyna D. Kowalska, Pedro Quílez, Agnieszka Bednarska, Dariusz Lipowski and Andrzej Horban

Medical University of Warsaw, Poland  
Universidad de Murcia, Spain

HIV and Viral Hepatitis 2014: Challenges of Timely Testing and Care  
Missed opportunities for earlier diagnosis

# Rationales

- A large proportion of HIV-positive persons is unaware of their status
- Expanding HIV testing is recognised as major tool in halting the epidemic
- HIV test is too rarely recommended by clinicians
- To understand this situation we have investigated knowledge on HIV testing among fifth year medical students („almost doctors”)

# Methods

- Fifth year students were pre-tested when entering the infectious diseases course
- Questionnaires were anonymous and covering three areas:
  - medical practice
  - transmission risk
  - indications for HIV testing
- Answers were scored according to a pre-defined scoring system

# Methods

## Indications for HIV testing scoring:

- ◎ Correct:
  - pregnancy **OR** sexual contacts/STI
  - **AND** relevant medical condition(s)
- ◎ Somewhat correct:
  - only relevant medical conditions
- ◎ Incorrect :
  - Non-relevant medical conditions

# Methods

- Chi-squared and Kruskal-Wallis tests were used for group comparison as appropriate (tests of significance were two-sided)
- A multivariable logistic regression model was developed including all variables with  $p < 0.1$  in univariable models
- Confidence interval (CI) of 95% was accepted

# Results

- ◎ In total 224 students were included
  - Europe (64%; 39% from Poland),
  - Asia (24%),
  - North Africa (6%)
  - North America (5%)
- ◎ 73% were from high income countries\*
- ◎ 64% were women

# Results

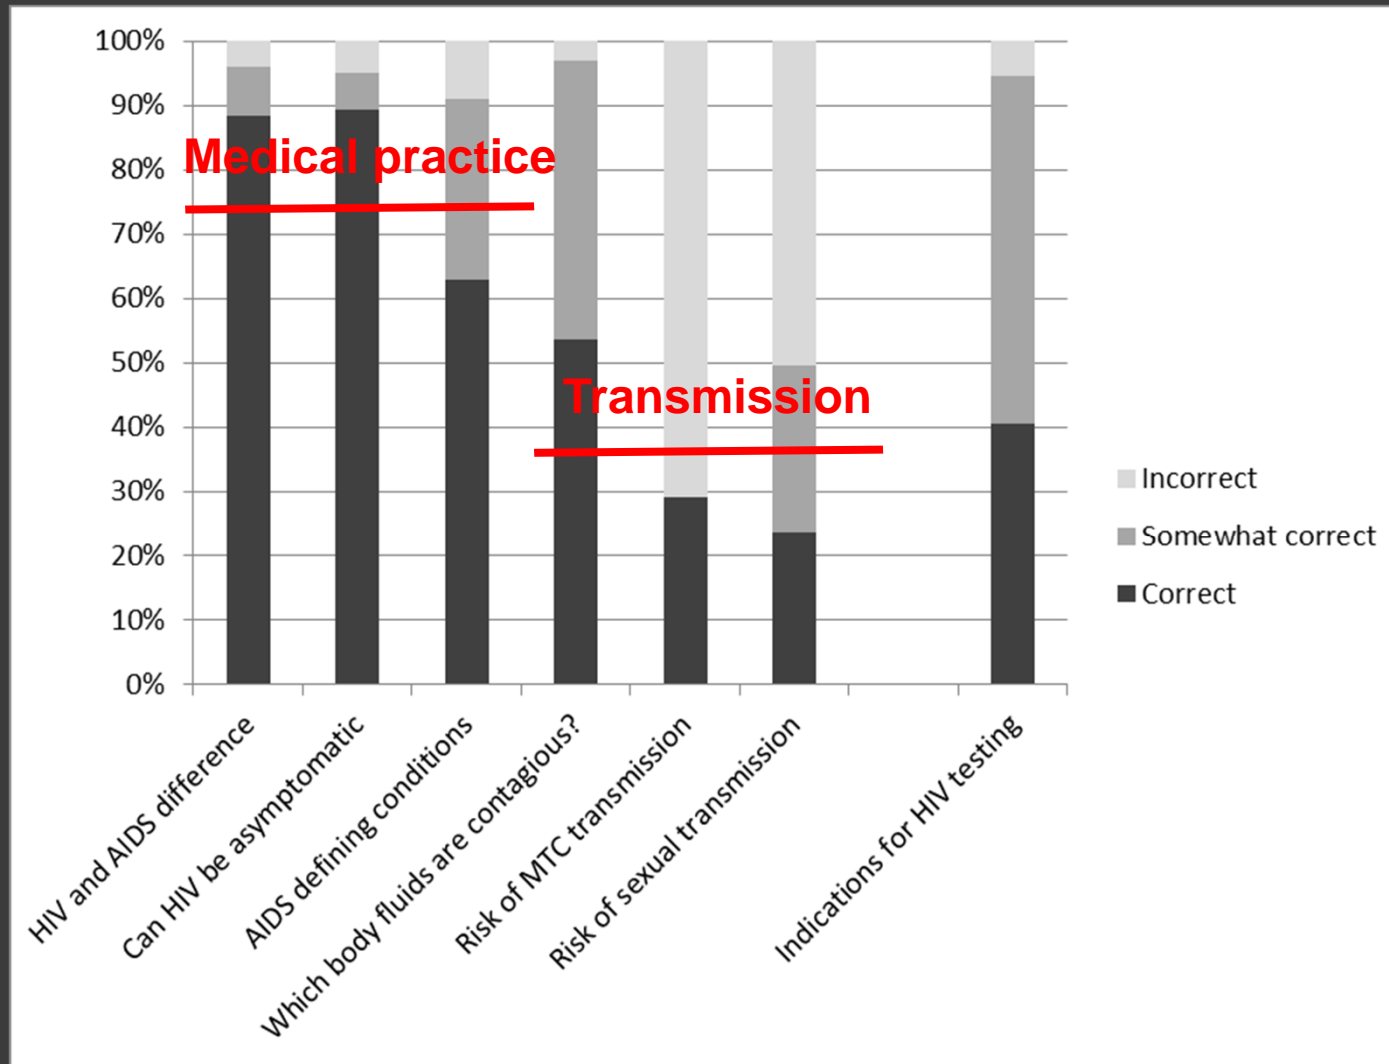

# Results

# Results

# Results

## Indications for HIV testing:

### ⦿ Correct:

- pregnancy **OR** sexual contacts/STI
- **AND** relevant medical condition(s)

### ⦿ Somewhat correct:

- only relevant medical conditions

### ⦿ Incorrect :

- Non-relevant medical conditions

# Results

## Indications for HIV testing:

- ◎ Correct: **41%**
  - pregnancy **OR** sexual contacts/STI **12% / 39%**
  - **AND** relevant medical condition(s)
- ◎ Somewhat correct: **54%**
  - only relevant medical conditions
- ◎ Incorrect : **5%**
  - Non-relevant medical conditions

# Discordant answers

- 28% estimated MTC risk as  $> 50\%$  and **DID NOT** included pregnancy as indication for HIV testing
- 20% estimated MSM risk as  $>10\%$  and **DID NOT** indicated sexual contacts as indication for HIV testing

# Results – baseline characteristics

Characteristic	Correct testing N= 91	Incorrect testing N=133	P value
Age (mean, SD)	24.3 (2.3)	23.9 (1.9)	0.33
Female (N,%)	60 (65.9)	83 (62.4)	0.67
Region (N,%)			0.04
North America	8 (8.8)	3 (2.3)	
North Africa	5 (5.5)	9 (6.8)	
Asia	27 (29.7)	28 (21.0)

Correct	22 (24.2)	31 (23.3)	

# ODDS RATIO FOR WRONG HIV TESTING

# ODDS RATIO FOR WRONG HIV TESTING

# ODDS RATIO FOR WRONG HIV TESTING

# Conclusions

- Students tend to represent condition-focused HIV testing approach
- they underscore the role of behavioral factors and the asymptomatic character of HIV infection
- this is especially relevant for European students planning to practice internal medicine

# Perspectives

- To evaluate students' knowledge across Europe
- Introduce more on HIV testing earlier in medical studies
- More on HIV testing during specific classes/sections

Thank you
